Category:Medical education software Category:Virtual anatomy This invention relates to a trigger mechanism and, more particularly, to a trigger mechanism which can be easily attached to the throat of a rifle and when pulled in the direction of the bore axis of the rifle causes the rifle to discharge a projectile. Heretofore, trigger mechanisms have been designed which can be attached to the trigger of a rifle and when pulled in the direction of the bore axis of the rifle cause the rifle to discharge a projectile. However, these trigger mechanisms are generally cumbersome to operate and are bulky in design. Q: LaTeX documentation with fancyhdr I am trying to create a document using TexMaker for my undergraduate thesis. I am having trouble making it so that the documentation (as in the text in the table of contents) is on the left, and the main text is on the right. I have used fancyhdr, which is definitely what I need, but no matter how I set the headers, LaTeX insists on putting my text in the header. Here's what I have: `\documentclass[11pt]{report} \usepackage[most]{titlesec} \usepackage{fancyhdr} \usepackage{makeidx} \usepackage{amsmath} \usepackage{amsfonts} \usepackage{amssymb} \usepackage{graphicx} \usepackage[bookmarks,colorlinks]{hyperref} \usepackage{relsize} \usepackage{fancyvrb} \usepackage{enumerate} \usepackage{url} \usepackage{latexsym} \usepackage{longtable} \usepackage{listings} \usepackage{enumitem} \usepackage{pdfpages} \usepackage{pdfpager} \usepackage{booktabs} \`

Category: Anatomy of the human body Influence of implant position and type of occlusal rest on implant/tooth contact. The objective of this study was to evaluate the influence of implant position and type of occlusal rest on implant/tooth contact. The sample consisted of 20 maxillary sinus lift implants with final connections and crowns. A replica technique was used to fabricate dental stone models of the same patient. An acrylic occlusal reference model was made. The implants were placed in the model according to the Branemark standardization system. Contact points were plotted on the models and registered by means of an optical scanning system. The following 4 different types of occlusal rest were used: occlusal model (OM), standard-size (SS), standard-shape (SS), and ultra-wide (UW). The implants were randomly distributed and assigned to 2 groups with 10 specimens each. Group 1 (A) did not receive an occlusal rest. Group 2 (B) received an occlusal rest of 1 of the following 4 different types: OM, SS, SS, or UW. Measurements were recorded before and after cementation of the occlusal rest. The results were compared statistically with a P /\* Copyright The Kubernetes Authors.
