Notebook execution failed. I have tried using different Python version but same error. Also, I have tried changing the way in which I access the nb file. I am using Spyder with jupyter. A: I changed the file path and solved the issue. How do you guys design your layouts? - JoshTriplett I find that some people are a little wary of using tables for layout, but for me that makes the layout easier to read, and more easily changes later. I'd like to be able to design a layout in Firefox without resorting to tables, but none of the off-the-shelf stuff seems to allow me to do that. ====== hemmu I design in Firefox, with a CSS file served from Apache that I maintain manually. When I update it, or the CSS file, I restart Firefox. ~~~ JoshTriplett It's great that you can do that. What are you using for serverside CSS? I wanted to try something like that, but couldn't find anything at first that didn't just give me a blank page without styling. My server has several domains. For each I have a page on that domain with a CSS file served from there. I have a wildcard DNS record for *.example.com that works in my local resolver, so any page on example.com gets served from example.com/css/style.css. ------ steveklabnik For the most part, I don't use tables for layout. This is all SASS and SassMeister to do the heavy lifting. On Feb. 28, the National Hockey League made the announcement that the Phoenix Coyotes had been sold to IceArizona (we think they're doing great naming!) in a deal that was reportedly worth over $170 million. The announcement also confirmed that the hockey team would relocate to a new stadium in Glendale, Ariz. That would mean that the Arizona Coyotes will play their games in a brand new arena — which some people will call a "rink" — in a city that's some three hours north of Phoenix, in the middle of nowhere. Still, the announcement brought with it plenty of buzz, including plenty of chatter about the new ownership and their plans. We already know about f3e1b3768c
