Jan 22, 2016 - Here's a method to unlock and remove the Sony BIOS Master Password from a Sony Vaio.[Life expectancy by main gender at birth in Italy and Europe]. To analyze life expectancy by gender, by birth cohort and by Italian Region, for the period 1970-2007. Data on life expectancy, compiled from the Italian National Institute of Statistics and on death registrations from the Italian Ministry of Health for the entire population and by sex and age at the period of their birth, was used. Population data were standardized to the European Standard Population. Poisson regression was used to calculate the relative and absolute changes in life expectancy, with 95% confidence intervals. Life expectancy increased in all Italian regions in the analyzed period. The increase in life expectancy for the Italian population is in line with the European average for women and lower than for men. The first half of the 70's was characterized by a significant increase in life expectancy for both men and women, with a higher increase for the first cohort compared to the second. The results in Italy indicate that life expectancy increased more than in other European countries. The different trends of life expectancy for the two birth cohorts could reflect differences in patterns of risk factors for mortality, such as smoking, obesity and diet, occurring at different periods of the life cycle.

The Swine Flu virus has hit as many as 120 million Americans this year, and nearly half of them are children. Here are some tips for you and your child. Do the math Make sure you understand the numbers. How many people are coming down with Swine Flu? How many will have fever? How many will get pneumonia? How many have died? The numbers may be hard to swallow, but you need to be able to understand them to know whether your kid is coming down with the flu, or something else. Be aware Make sure you know what to do if your child gets the flu. The first sign you have a child with Swine Flu is usually a fever and a runny nose. When your child's fever rises over 102, he or she may be sick enough to need to be seen by a doctor. If your child is healthy, there are other symptoms to watch for, such as a cough, sore throat, a runny nose, or a rash on the cheeks and neck. Once your child has symptoms, or if you think he or she may have Swine Flu, take the child to the doctor immediately. (If your child doesn't need to be seen by a
