Domain Adaptation using Attention Transformers by Yujie Shen Work-related issues During the formative years of the internet, the major challenge for the domain name system was to establish domain names for the multitude of domains that were being created by companies around the world. Each application, be it a web site, a document repository, an online book store or a search engine, created its own domain name system for a single domain. The challenge for the NCC was to prevent a proliferation of domain name systems, something that would have complicated and slowed down the growth of the internet and, more importantly, its adoption by businesses, governments and individuals around the world. This led the NCC to develop the Uniform Domain Name Dispute Resolution Policy (UDRP) in 1999. The UDRP works by allowing a person who believes that they are the rightful owner of a domain name to bring a suit against the other party or parties who they believe to be using that domain name unlawfully. Citing conversations with former National Security Agency contractor Edward Snowden, Wyden told the BBC the hackers targeted the White House. Wyden said he had personally discussed the problem with President Barack Obama in 2015, in the weeks following Snowden's revelations about the extent of the NSA's bulk data collection. "I think it was within the last three months, I think there's a pretty good probability that the White House was attacked and that we might see the results of it," Wyden told the BBC. The head of the NSA has previously said that the NSA doesn't have access to the so-called "secret court" that approves surveillance, and that there is no evidence that the agency collects data outside of its legal authority. The Snowden leaks revealed that the NSA had used spy programs to siphon data on Internet communications, on phone calls, and on cloud computing. When asked if he believed the evidence showed that the White House had been hacked, Wyden said "Yes, I think there is evidence to suggest that that happened." "I think it was a targeted, focused operation against the White House, that's my understanding, that's based on conversations I've had with people who've spoken to the NSA and with the FBI and with the CIA," he added.
