Ohm's Law. $\Omega = R \times I$. Power (Watt). Watts: the basic unit of power. Watts (W) used to measure the amount of heat given off by electrical components. The watt is also a measure of electric current in the case of alternating current. A converter is a device that changes the voltage of an alternating current (AC) source or a direct current (DC) source to another voltage. If the original and final voltage differ, it is a step-down converter if the final voltage is less than the original. If the final voltage is greater than the original, it is a step-up converter. UPSs are available in: a wide range of sizes, from very small units to very large units. The smallest of these units is commonly referred to as a line interactive or a single stage UPS. As its name implies, the line interactive can power only a single circuit or appliance. There are many applications for line interactive UPSs. Line interactive UPSs may be used with telephones, telefax machines, remote equipment, computer systems, and many other devices and circuits which require uninterrupted power in case of a power outage. The UPS is connected to a power feed line supplying power to an external circuit. If the supply is interrupted, the UPS will provide power to the external circuit. Most line interactive UPSs are battery powered, usually the same battery as the one in the main equipment, and have their own regulator. The batteries are usually nickel cadmium, alkaline, or lithium ion. UPSs with batteries have the advantage that they can provide power to equipment where a power supply cord might be inconvenient. a very low cost or ultra-low cost UPS which is designed for home use. These units are generally very small and inexpensive, but are more susceptible to damage from surges or brownouts than large, expensive UPS units. These small UPSs are typically used to protect desktop computer systems and small appliances such as microwave ovens, toasters and coffee makers. Most units are powered by mains voltage and are usually not connected to an AC power source. A UPS (Uninterruptible Power Supply) is a device which supplies power to an electrical circuit or appliance even in the case of a power outage. These devices are designed to keep a supply of electricity available as long as possible. UPSs are used primarily to supply electrical energy to prevent or minimize the loss of data. UPSs will also supply electrical energy to keep electrical equipment functioning

I had done everything I could to be healthy. I ate right. I got my sleep and meds. I was going to be a mom! I had had no morning sickness. I was having a great time with my husband (we were both excited to have a baby). I woke up feeling groggy one morning. I felt myself getting a little queasy, but I made it through work. It was an exciting day, my husband and I decided to walk the waterfront. I loved walking on the shoreline, the wind in my hair, the view, and the cool breeze on my skin. At the end of the walk, I felt a bit queasy. I decided to see if I could eat anything else. Nope. This time of year, we usually have a strong 'North Sea' (wind) which is cool, but it can make you feel a bit queasy. I didn't have to make any changes to my diet. I drank some ginger ale and some water. After a day or two, my queasiness started to grow. It became uncomfortable. I just had to get home, I didn't want to be in the office, even if it was 5:00 p.m. I also did not feel like going to the store and buying some 'exotic' fresh food. I was fortunate that one of my great friends from our community, Debbie, was visiting from out of town. She offered to help with meals. I accepted the offer. Sometime in the second week, I woke up feeling really queasy. There was a constant feeling of nausea. I felt like I needed to be somewhere private, but I couldn't be away from my husband and baby for too long. Debbie made me some delicious breakfast, a delicious lunch, and some dinner. Thank you, Debbie! I was able to work on time and still stay with my husband. As I entered week 3, I started to feel really unsettled. I wasn't sure what was going on. I didn't like the way I felt. I felt like I wasn't a 'real mom'. I started to check to make 2d92ce491b
