===== Add functionality to a standard keyboard driver to provide VNC capability on your computer. The KEYMACRO driver allows you to access the keyboard in a text based VNC session using a similar interface to that provided by the X Window System. You can then simply use a VNC client to connect and view your desktop on the remote computer using your existing keyboard. Background: ===== VNC (Virtual Network Computing) allows you to view and interact with your desktop on a remote computer. The remote computer may be a desktop computer, or a server computer running a web site or other software. There are many VNC programs available and they run on a wide range of operating systems including Windows, Linux, BSD and OS/2. If you don't know what a VNC program is, you should take a look at INSTALLATION: ===== To install, just extract the *.zip file into a suitable location, for example: mkdir /home/username/dist cd dist unzip KEYMACRO-0.16.zip NOTE: If you are running the program for the first time, you need to tell the program where to find the driver and then reboot to fully load the driver. In the file /home/username/dist/KEYMACRO-0.16/setup.conf, the default location of the driver and the device which KEYMACRO will be used to control should be set, see also: INIT/EXIT/DEBUG ===== The program needs to be told to start at boot time, so make a suitable entry in /etc/rc.local. If the program is to start on the same machine every time the machine is booted, you can just add a call to run-on-start-up. If it's to start on a remote machine, you need to tell it the IP address. The command to run to start the program is: "/home/username/dist/KEYMACRO-0.16/setup.sh start" (if the setup.sh file exists, it will be used to start the program.) REMOTE ACCESS ===== To start a remote access session, open a VNC connection to the remote computer, for example: vncviewer -fullscreen -inet 10.0.0.X -listen 127.0.0.1
The -fullscreen 77a5ca646e

Just plug it in and point your mouse to the appropriate virtual screen, and it works. This is all that VNC can do on its own. You can connect to the same computer with another computer, and both can use this connection to view and control the remote computer at the same time. The connection is even bidirectional, so you can connect to another computer, and view it on the first. The connection is secure, and can even be used to log onto other computers as well, if you have the remote computer's credentials. The software can run on Windows XP, Vista and Windows 7, and even Win8. Unlike other software available to view a remote computer, this software is completely free, publicly available and very easy to use. VNC is designed to allow you to connect to the remote computer, control it and view its output on your local computer. If you have any questions on this, please feel free to ask. Q: Is this the best approach for using StreamWriter and using " " as a delimiter? I'm working with File/StreamWriter to append the contents of a text file to an output text file. If the output file doesn't already exist, I am going to create the file and then just append the input file to it. Is this the best approach? If the input file looks like this: ABC DEF GHI And the output looks like this: 1 2 3 Is it better to keep reading from the text file until it hits the new line character or is there a better way to use the streamwriter? string inputFile = ""; string outputFile = ""; inputFile = ConfigurationManager.AppSettings["InputFile"]; outputFile = ConfigurationManager.AppSettings["OutputFile"]; using (StreamWriter output = new StreamWriter(outputFile)) { using (StreamReader input = new StreamReader(inputFile)) { string line = ""; string currentLine; int currentLineNumber = 0; while ((currentLine = input.ReadLine()) != null) {
