Predictors of readmission for patients who underwent thyroid surgery at a community hospital. Readmission after thyroid surgery may be associated with permanent nerve injury and the need for reoperation. This study evaluates the incidence of readmission within one week of discharge from our facility, and identifies predictors of readmission after thyroid surgery. A retrospective chart review of all thyroid surgeries performed by a single surgeon between January 2009 and December 2011. At the time of discharge, patients were educated about potential signs and symptoms of recurrent laryngeal nerve injury, and reassured about the expected outcome after surgery. All readmissions within the first 7 days of discharge were analyzed. A total of 362 patients were identified during the study period, including 98 men and 264 women with a median age of 51 years. The median duration of hospitalization was two days (range 1-87 days). One hundred fifty-eight patients (41.7%) had no postoperative complications. Among the 213 patients (58.2%) who experienced postoperative complications, only 49 patients (22.6%) were admitted to the hospital within the first 7 days of discharge. Of the 170 patients who were readmitted within the first week, 66 (39.5%) experienced postoperative complications, and of those, 24 patients (13.5%) needed reoperation. Predictors of readmission included hypertension (odds ratio [OR]: 4.32; 95% confidence interval [CI]: 2.16-8.60; P Q: Does word-wrap:break-word: I couldn't find a clear answer for word-wrap:break-word or word-wrap:break-all with CSS. Q: How to build an API gateway using cpanel? I have a simple basic website running on cpanel. The website serves content based on the argument sent in the request. I would like to make this argument a command line argument so I can send it in the URL, and display the respective content. Is there a way to create an API gateway so I can use this command line argument as a valid URI? Or, is there a way to redirect the request to a specific page so I can change the respective content? A: The easiest way for you is to create a forwarding rule. Go to Forwarding Rules -> forward page Fill in the following fields: Forwarding page URL: /your_page_path Forwarding page response: empty Forwarding page response headers: empty Forwarding page status: 302 Forwarding page method: GET Next add the forwarding rule rules via the Link for forwarding rules menu. Under the same menu add a new forwarding rule Copy the Rules ID of the previous rule, and paste it under the Base URI field: And that's it. You're forwarding your requests through the website. Now, you can send a command line argument to the website, and modify its response accordingly. If you want to change the page that the request is sent to, you can use an Apache rewrite rule.
