**Key Macro Description:** This function generates a shared secret key from an input key and a user-specified macro. The macro is a key-value pair that consists of an alphanumeric string (A-Za-z0-9) and a 32-character hexadecimal string of arbitrary length. An example key macro is: "0001020304050607709" **Related KeyMacro Functions:** SYNOPSIS DWORD wodSFTPdll\_Open( PBYTE pbMacro, PBYTE pbPass, DWORD dwFlags ); DESCRIPTION The wodSFTPdll\_Open function generates a shared secret key from an input key and a user-specified macro. The macro is a key-value pair that consists of an alphanumeric string (A-Za-z0-9) and a 32-character hexadecimal string of arbitrary length. An example key macro is: "0001020304050607709" **IMPORTANT:** For the 16-character macro, you should change the MACRO\_LENGTH value in the include file so that it is 16 (i.e., for the "0001020304050607709" example macro, change the MACRO\_LENGTH value from 4 to 16). **RETURN VALUE** If the function succeeds, the function returns 1. If the function fails, it returns 0 and the last error code. **ERRORS** The following error can occur. **ERROR\_KEY\_LENGTH** The macro length is invalid. **ERROR\_INVALID\_MACRO** The macro value is invalid. **Possible errors, when invalid data is used:** wodSFTPdll.pas SYNOPSIS DWORD wodSFTPdll\_Open( PBYTE pbMacro, PBYTE pbPass, DWORD dwFlags ); DESCRIPTION The wodSFTPdll\_Open function generates a shared secret key from an input key and a user-specified macro. Using it, it is possible to transfer data in a secure manner over the SSH protocol by relying on BLOWFISH, DES and AES encryption modules. It is compatible with various SSH2 servers, features support for proxy servers, it can copy data straight from and to variables, while also being capable of asynchronous and blocking modes usage. Among the features that it encompasses, users can find the PutData and GetData methods (used for copying string variables to or from remote files), but also PutFile and GetFile for uploading data or downloading it, depending on the situation. Additional methods include MakeDir and RemoveDir, ListItems, DeleteFile, GetAttributes, Resume, SetAttributes, Blocking mode, PublicKey and Password properties, ASCII and Binary transfer modes, as well as a Done event that is launched whenever a method is completed, to

A license key is a unique string that you provide to apply an activation or a trial period to a license agreement. It helps you manage your user licenses, up-sell to paying customers, or keep user/s from being able to install your software over and over again. The key that you provide to your customers is your license key. It can come from a web page (https) or any other source that your customers can use to enter it. To allow you to create and manage your license keys yourself, we offer the following subscription options. More details on License Keys More information about licensing can be found at the following link: License Keys 101 A license key is a string of characters that is associated with your product, whether it's an application, component, or module. We recommend that you keep a list of your product's license keys, or consider setting up a web site that allows you to manage your license keys. You can use a license key to grant or restrict access to your products. For example, you can require a license key for a software development kit (SDK), or you can use a license key to allow an application to be run only one time on a computer. You can also use a license key to restrict the number of activations for a given
