Apple's WatchOS 4 is now available to all Apple Watch users, and the first big change in the operating system's name may not be the last. Starting with WatchOS

What's New In?

===== Home Assistant is a fully-fledged, open-source, self-hosted solution for both, domestic and commercial use. Home Assistant helps you control your Internet-of-things and remotely manage your home's automation. The interface of the application is divided in two parts - a web application and the desktop app. The web application can be used remotely (via mobile phones or the Internet) to configure and control the desired component of your smart home. The desktop app is designed to allow you quick access to the same dashboard/system management panel available in the web application. You may configure the desktop app to display what you see fit for your needs. - Single installation - Supports the integration of several "things" - Works with stateful agents - Open source - Home Assistant is a fully-fledged, open-source, self-hosted solution for both, domestic and commercial use. Home Assistant helps you control your Internet-of-things and remotely manage your home's automation. Home Assistant supports the integration of several "things" to a single node within your home. For example, the module should allow you to control the state of your lights and outlets and also allow you to monitor their states - but only if you are within a secure zone. An agent is a software module, a component which has a state and makes actions when its state changes. Every Home Assistant app has a stateful agent associated with it. Therefore a "thing" might have multiple agents and a combination of actions and states. For example: If a Smart Thermostat has both "on" and "off" states and a "lock" and "unlock" action - the agent for the thermostat might be the "Lock thermostat door" agent. The "Lock door" agent might be using the "Toggle lock" action to flip a boolean switch on / off. If the toggle switch is in the "on" position, the "Lock door" agent returns a "true" state. Otherwise, the "Lock door" agent returns a "false" state. Therefore if the toggle switch is in the "off" position, the "Lock door" agent goes into "off" state and the "Lock door" stateless agent "locks" the door. Conversely, if the toggle switch is in the "on" position, the "Lock door" agent goes into "on" state and the "Lock door" stateless agent "unlocks" the door

System Requirements:

32-bit or 64-bit operating systems Processor 2 GHz or higher RAM (recommended: 2 GB)
Hard Disk space 300 MB Dependencies Vim or Vi - Org mode as your editor, I used ViM
Qt - QT Creator for development, You can also use QtWebKit if you want or your choice
Versioning App is compatible with 1.2.0 and later Developing and debugging If you're
using Linux,
