===== The keymacro utility is mainly used to open and close the DMI MEI driver. However, it is also useful when you have the need to terminate the MEI driver. On Windows operating system platforms, the tool needs to be run from a command line window of an elevated administrator account. Functionality-wise, the tool works on the basis that you enter your BIOS password as the argument. Lastly, take note that the command will work only when the MEI driver is installed and enabled on the platform. KEYLOG Description: ===== The keylog utility allows you to view all the keys entered into the system. The utility needs to be run on a single system and to use the command line, in order to be utilized by an administrator account. KEYFIND Description: ===== The keyfind utility allows you to retrieve the MAC address of every possible key available. The tool is intended to be run on a single system with elevated administrator privileges. As mentioned earlier, the process works by entering your BIOS password. It will then retrieve the MAC addresses. KEYREAD Description: ===== The keyread utility allows you to read the BIOS data. On Windows operating system platforms, the tool is run on a single system with elevated administrator privileges. Similar to the previous tool, the process works by entering your BIOS password. However, this time it will retrieve the data stored in the BIOS system. LOGDOC

### What's New In?

This app will retrieve a full set of information about MEI device drivers for the installed platforms. It can also retrieve information about a particular MEI device and identify its vendor and model. "Intel Active Management Technology (Intel AMT) is a set of components designed to provide remote management of the platform in order to assist IT administrators. Intel AMT is designed for use in managed environments such as data centers. Intel AMT is based on the Intel MEI (Message-Exchange Interface) Specification. The specification is designed to provide an interface to enable the exchange of system and device management messages among the Intel MEI components. The interface is designed to be implemented using the Intel Management Engine Interface (Intel MEI) driver. The specification is available from the Intel website. " Description: Intel System Discovery Utility is a special tool for retrieving full set of information about MEI devices. For an overview of MEI component, please see "Install this tool from the Intel Software Support Package (ISSP) toolkit. The ISSP is a file format containing all the files, registry entries, and registry keys associated with supporting Intel products and systems, as well as Intel Software Development Kits (SDKs). This toolkit includes a driver, utility, and ISSP files to install and configure the Intel MEI driver." Description: Intel MEI driver "The purpose of the Intel MEI driver is to be a single, common interface between Intel Platform Management (Intel PM) and the platform's platform management and security components. It provides a common interface for these components to receive and process messages. It also acts as a pass-through interface for messages being exchanged between the Intel PM and platform management and security components. The MEI driver is an Intel PM component. When enabled, it provides interfaces to communicate with the platform's hardware security and management engine (HSME) and platform management and security components (PMACS). When the MEI driver is installed, it will disable the MEI agent service." Description: Intel MEI driver log "The Intel MEI driver also writes a log to a separate file. This log file contains informational messages that the MEI driver processes. The log is intended to contain information about the MEI driver and any messages the MEI driver processes. If the log file is created, the information in the log file is sent to the Intel MEI Manager by the MEI driver. The log file is called Intel-MEI-log.txt and is located at %SystemDrive%\Intel-MEI-log.txt." Description: Intel MEI driver version
