He makes jokes about his appearance, often at his own expense, and relishes his role as someone who keeps a close eye on the game. Last weekend the stands had a glimpse of what he could do in a match. Rangers reserves coach John Hughes was suspended by the Scottish Premier League this week for encouraging a fan to produce a banner supporting Scotland's World Cup heroes in Wednesday's 1-1 draw with Malta, rather than watching on TV. Yesterday, the Football Association of Ireland had to deal with similar off-the-field antics when Wrexham winger Scott McDonald provided the entertainment by mimicking an insane squirrel. Irish football is notoriously serious, but McDonald and his antics certainly seem to have brought a light-hearted touch back into the game. What do you think of it all? '*s. In this case, given the strong predominance of *F. novicida* in the exposed animals, the distinction between two groups (i.e. *F. tularensis* and *F. novicida*) based on the MLST scheme was more robust than the distinction between colonized and exposed animals, and the relevance of the MLST classification for the development of different strategies for the mitigation of the impact of *Francisella* infections on the safety of foods remains unclear. On the basis of the whole MLST scheme, it may not be possible to identify the origin of the outbreak, in view of a limited number of strains for which the location of the outbreak and the duration of the exposure to contaminated food products are not known ([@r2]; [@r10]; [@r23], [@r24]). As suggested by the two different MLST schemes, some of the strains appeared to have the most likely origin of the outbreak, whereas others may be present as natural communities in soil and water, or may be isolated as part of the normal microbiota of multiple wildlife species. In this context, the taxon CFSAN086526 has been isolated from *I. virginica* and appears to have come from the United States ([@r23]). In France, *F. novicida* is one of the most prevalent *Francisella* species found in both ticks and small mammals ([@r10]; [@r23], [@r24]; [@r27]). In contrast, the taxon CFSAN086351 has been isolated as part of the normal flora of various food-producing animals, including cattle, goats, sheep, chickens, pigeons, and rabbits ([@r23], [@r24]). Finally, the taxa CFSAN086784, CFSAN086511, CFSAN086325, CFSAN086516, and CFSAN086518 have been isolated as part of the normal microbiota of humans and animals and appear to have come from multiple parts of the world ([@r23], [@r24]). The two strains CFSAN086352 and CFSAN086783 were recently reported in a foodborne outbreak associated with the ingestion of watermelons (*C. melo*) associated with ulcerative enteritis ([@r30]). Another two of the seven foodborne *F. novicida* strains were
